

Task ID/Title: AI used as a Teaching Assistant: US-04.01

Purpose of AI:

I used AI (ChatGPT 5.6 sol) as a teaching tool to learn.

I used it to learn how to use supabase as a database to store files and sensitive credentials. I told it to show me how it could be done and to give me example.

Chat Conversation History Link:

AI-Suggested Content:

It taught me how to use Supabase and how to integrate it, I tried it out externally (through something not related to the project so I don't harm it if I do something wrong by mistake). Thanks to ChatGPT and some youtube videos and internet documentations, I was able to implement Supabase to store the resumes' that the users upload.

Validation:

I verified the output by first seeing that it matches with Youtube video guides and internet documentations about Supabase, I also tested it out in an external test and it worked. So because of that, I knew that I could safely integrate it to our project. I told Liam that it is safe, he created the Supabase project, and then I used the keys from it to integrate it to my backend part.

Decision:

Accepted, implemented it to our project.

Reflection:

I learned that AI is extremely helpful in teaching how to use new tools, however, the problem with it that it has so many logical traps, for example, it forgets to explain important stuff.
